

Aggregate Functions

CS 2550 Database Design 2023
Cody Henrichsen

1

Definition

- Aggregate functions operate on an entire COLUMN's worth of values compared to the values in individual cells
- The column type must 'fit' the function
 - You can MIN a date or text
 - You can't AVG a text or a date

id	first_name	last_name	email	phone_area	phone_number	hire_date
1	Jeff	W	jeff_w@comp.com	916	555 1234	2000-09-01

2

Which functions?

- COUNT
 - The number of rows that match
- AVG
 - The mean average numeric value
- MIN
 - The smallest value specified
- MAX
 - The largest value specified
- SUM
 - The total of all values in the column

3

How?

- ▶ All the aggregate functions take a single parameter and return a single value
- ▶ AVG/MAX/MIN/SUM each take the column, the results of which are analyzed or operated on.
- ▶ COUNT takes **ONLY** the * as its parameter as it returns the number of rows in the the query that are returned
 - ▶ On its own just rows in table
 - ▶ Especially useful with the GROUP BY clause for group counts

4

Extra Clauses

GROUP BY

- ▶ **REQUIRED** for ALL columns not linked to an aggregate function
- ▶ Columns separated by commas
- ▶ Extra columns invalidate results
- ▶ Order is not required but follow the SELECT clause
- ▶ Written after the FROM/WHERE clauses
- ▶ Executes **BEFORE** the SELECT clauses

HAVING

- ▶ Optional
- ▶ Used to limit rows based on results of an aggregate function (like WHERE)
- ▶ Written after the GROUP BY clause
- ▶ Executes before the SELECT clause

5

When?

- ▶ If more columns than what the aggregate function is called on, the required GROUP BY clause is going to execute **AFTER** the FROM (of course) and WHERE clauses, but **BEFORE** the SELECT clause since the coalesced column values need to be grouped together (lol)
- ▶ The optional HAVING clause also occurs **BEFORE** the SELECT clause since this is how the now coalesced results are then filtered before becoming available to the SELECT clause

6

Execution order

1. FROM
 - Pick the table(s)
2. WHERE
 - Limit results based on other value(s)
3. GROUP BY
 - Identify and isolate based on column values
4. HAVING
 - Limit results based on result of aggregate
5. SELECT
 - Pick the columns to display

7

Execution order of a query

```
4 SELECT
  section_id,
  COUNT(*) AS enroll_count
1 FROM
  enrollment
2 GROUP BY
  section_id
3 HAVING
  COUNT(*) > 4
5 ORDER BY
  COUNT(*),
  section_id
;
```

8

Demo Query

Worksheet Query Builder

```
1 SELECT
2   section_id
3 FROM
4   enrollment;
```

Results

SECTION_ID
99
101
99
101
99
101

226 rows selected.

9

Limit query with DISTINCT

Distinct Query

```
6 SELECT DISTINCT
7   section_id
8 FROM
9   enrollment;
10
```

Distinct Results

SECTION_ID
102
100
147
117
123
92
150
138
91

64 rows selected.

10

Use Aggregate Function

Aggregate Query

```
11 SELECT
12   section_id,
13   COUNT(*) AS enroll_count
14 FROM
15   enrollment
16 GROUP BY
17   section_id;
18
```

Aggregate Results

SECTION_ID	ENROLL_COUNT
148	5
149	1
150	3
151	2
152	4
153	3
154	4
155	5
156	8

64 rows selected.
